"Fatal Agranulocytosis During Treatment with Favistan."

Belgrade, Srpski Arhiv za Tselokupno Lekarstvo, Vol 91, No 4, Apr 63; pp 421-425.

Abstract [English summary modified]: Case report: woman aged 41, severe hyperthyroidism. Methimazole 20 mg. t.i.d. was followed within 10 days by a severe allergic syndrome with total agranulocytosis and bone marrow aplasia, with lethal issue despite voluminous repetitive transfusions, prednisone, vitamin C and antibiotics. Passive transfer test was highly positive. Table; 1 Yugoslav and 22 Western references.

TITLE: Medical and social aspects of mortality caused by criminal abortion

SOURCE: Medicinski glasnik, no. 4-5, 1965, 93-97

TOPIC TAGS: injury, biologic reproduction, surgery

ABSTRACT: Review of data on 27 necropsies of women who died as sequelae to criminal abortion from among 2,641 necropsies carried out during the three-year period, 1960-1962. Analysis revealed that this is only a small proportion of fatal cases attributable to criminal abortion in Belgrade and environs; the primary cause is inadequate education as to a) contraceptive practices, b) possibility of steps to obtain permission for legalized abortion, and c) dangers of criminal abortion. Five of the cases are described in some detail. [JPRS]

AUTHOR: Mička, Ivan

TITLE: A method of formation of several zones at the vertical zone melting

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 7, 1962, 56, abstract 70391
(Czechosl. pat. No. 98820, 15.03.61)

TEXT: To accelerate the process of purification at the vertical zone melting, it is suggested to produce along the purified rod simultaneously several molten zones, whereby one of the zones is melted fully over the whole cross-section of the rod, whereas other zones are melted partially so that inside the rod a hard core remains. The diameter of the latter must be very small in relation to the diameter of the rod. In the process of melting the zones are shifted gradually so that finally a complete melting of the rod is secured.

N. Sirotina

Vanilla Jaroslav Červený and Jan Měkka (chem (Obor 25, 37-41, 62-63(1260)).--History, history origin and source, selection (grades), curing, maceration, and percolation of vanilla beans with 50% alc. by vol. at temp. 30-40° for 11-13 days and aging of vanilla ext. in white oak (*Quercus alba*) barrels lined with paraffin are described. The moisture from the vanilla beans is introduced into the ext. during the maceration and percolation and alc. is decreased to 44-45%, by vol. in the finished ext. Evaluation of the vanilla beans and the exts., lead nos. by Winton (*Analysis of Foods*, 1943, pp. 921-2) C.A. 30, 129P and Wichmann (*A.O.A.C. Methods of Analysis*, 5th ed., 1940, p. 321 (C.A. 43, 47(175)) methods, chem. analyses, and adulteration of the exts. is discussed. The exts. from Mexican and Bourbon vanilla beans are of the best quality, each having its own characteristic flavor and aroma. Usually blends of these two are used in baked products and ice cream. For flavoring the optimum quantity of vanilla ext. of standard strength is 3 kg. per 100 kg. of flour in bakery products and 0.6 kg. per 100 kg. of the finished ice cream. Actually much lower quantities are used in the industry, 0.5-1.5 kg. per 100 kg. of flour and 0.1-0.4 kg. in ice cream. NaHCO_3 destroys vanilla flavorings in baking and pH of the finished baked products should be 6.5 or lower. If vanilla beans are used as such either mixed with sugar or directly added to the batch to be flavored only 20-25% of the flavorings and aroma are utilized while extn. with dil. alc. 85-95% of the flavoring and aroma is liberated from the beans. tionsabhängigkeit zwischen drei tabellierten Größen
mittels Fluchtlinientafeln. Apl. Mat. 2 (1957), 279-296.
(Czech. Russian and German summaries)

4
1-F/W

This note evolves a method to construct nomograms
from tabulated values of three-variable correlations. With
the help of these nomograms the functional relationship
can in turn be verified. The authors select 6 types of
functional relationships (which later are shown to be
essential and interrelated): (I) $z = ax + by + c$; (II) $z =$
 $ax^m y^n + b$; (III) $z = ab^x c^y + d$; (IV) $z = ax^m b^y + c$; (V) $z =$
 $a \log x + b \log y + c$; (VI) $z = a \log x + by + c$. A method to
construct the nomograms and evaluate the constants in
the derived functional relationships is given and is
applied, as an example, to three technically interesting
cases showing the utility of the 6 types under discussion.

Depolarization of the dropping mercury electrode by sus-
pensions of insoluble substances. I. General observa-
tions: Karel Micka (Polarographický ústav CSAV, Prague).
Chem. Zvesti 19, 1144-7 (1955). -- Every ppt. is characterized
by a max. of polarographic current at a certain potential.
Some ppts. are polarographically reducible (HgS , PbS ,
 CuS , Ag_2O), some are not reducible (CdS , $BaSO_4$, $PbSO_4$).
Steady stirring is necessary for the reduction to take place.
The reduction of suspensions is probably due to the existence
of adsorptive forces between the electrode and the ppt. At
a certain potential the adsorptive forces reach their max.

Title: Polarographic Maxima of Second Kind in Solutions Purified with Activated Charcoal

Original

Periodical: Polarograficka maxima II druhu v roztocich vycistenych aktivnym uhlím. Chem. listy, 1955, 49, No 8, 1148-1151; Czech; Sb. chekhosl. khim. robot, 1956, 21, No 4, 940-944; Russian; German resumé

Abstract: It was found that addition of activated charcoal to a solution containing Cd^{2+} , Hg^{2+} and Tl^{+} , results in growth of polarographic maxime (M) of 2-nd kind (Kryukova, T. A., Zh. fiz. khimii, 1946, 20, 1179; Zavod. laboratoriya, 1948, 14, 511, 639; 1948); and the M is observed over a wider interval of potentials. Activated charcoal frees the solution more thoroughly from surface active substances (SAS) than can be achieved by other methods. It is

Card 1/2

Abst Journal: Referat Zhur - Khimiya, No 19, 1956, 6.182

Abstract: shown that SAS at concentrations which are usually characteristic of aqueous solutions of inorganic substances exhibit the same activity as a $2 \cdot 10^{-4}$ % solution of gelatin. Studied were the movements of electrolyte at the surface of Hg drop, which accompany M of 2-nd kind. A new type of M has been discovered which is characterized by irregular nature of these movements and a non-dependence upon concentration of inert electrolyte.

Title : Polarographic Half-Wave Potentials. VI Half-Wave Potentials of Zinc.

Orig Pub : Chem. listy, 1956, 50, No 2, 203-212; Sb. chemosl. khim. raot, 1956, 21, No 5, 1246-1256

Abstract : For the purpose of ascertaining the reversibility of polarographic reduction of Zn^{2+} exact determinations of E_1 were carried out in solutions of $NaClO_3$ and $KClO_3$ of different concentration, at different concentrations of Zn^{2+} and depending upon constants of the capillary. Correlation between E_1 and $\sqrt{\mu}$ (-- ionic force) is practically linear over the whole concentration range, which made it possible to extrapolate E_1 to $\mu = 0$. The obtained value $(E_1)_{\mu=0} = -0.985$ v (saturated calomel electrode) at 25°C is in good agreement with the value calculated on

✓ 1981. Depolarisation on the dropping-mercury electrode by suspensions of insoluble matter. II. Suspensions of bivalent iron, cobalt²⁺ and nickel sulphides. L. M. Micks. (Polarogr. Inst. Acad. Sci., Prague, Czechoslovakia). *Chem. Listy*, 1987, 81 (2), 233-242. — By studying the polarographic behaviour of aq. suspensions and colloidal soln. of FeS, NiS and CoS, it has been shown that the suspension yields a catalytic current on the dropping-mercury electrode, indicated by a sharp max. (— 1.5 to — 1.7 V vs. the S.C.E.). The magnitude of the current depends on the time elapsed since the preparation of the suspension. The time elapsed between the formation of the sol and the origin of the catalytic current has been defined as the coagulation time, and this is said to increase with the stability of the sol. The observed effects are not quite clear from the theoretical point of view, but are of practical importance, e.g., in polarographic titrations, when the presence of suspensions can cause interference.  Theory of the polarization of the mercury electrode by
 alternating current. Karel Micka (Acad. Sci., Prague).
 Z. physik. Chem. (Leipzig) 266, 846-848 (1957).—Theoretical.
 A theory is developed to explain the curves $E = f(i)$,
 $dE/dt = f'(i)$, and $dE/d\omega = f''(\omega)$, obtained by impressing
 a.c. in the polarization of the dropping Hg electrode.
 Because an exact analytical soln. is not possible, an approxi-
 mation soln. is worked out and by comparison of exptl. and
 theoretical curves it is shown that the theory conforms well
 with the exptl. results. Friedrich Bapatim.

TITLE: Galvanic Cells ^{QA}

PERIODICAL: Chemické listy, 1960, Vol 54, Nr 3, pp 229 - 259

ABSTRACT: The author introduces the topic via brief definitions (Refs 1-3). Such primary cells as dry cells (Table 1 deals with their composition and characteristics after Ref 1; see also Refs 4-15); cells with dry electrolytes (Ref 16); wet cells (Ref 17); storage cells (Table 2, which deals with the composition and characteristics of storage cells, as in Table 1, Ref 1; see also Refs 18-20); fuel cells (Refs 21, 31) and standard EMS cells. The reviewer then deals with secondary cells which fall into the following types: lead accumulators (Ref 22, see Table 3, which deals with the composition and characteristics accumulators - Ref 1, see also Ref 32); Ni-Fe accumulators (Ref 23); Ni-Cd accumulators; Ag-Zn accumulators (Ref 24) and Ag-Cd accumulators. The reviewer also concerns himself with the conversion of nuclear energy to electricity (Refs 25-27) as well as the conversion of solar energy.

TITLE: Development of Fuel Cells

PERIODICAL: Chemické Listy, 1961, No.2, pp.129-138

TEXT: The present paper is a literature survey of this field, covering the literature up to and including 1960. No contribution by Czechoslovak research workers is listed except for the author's remark that the thermodynamics of fuel cells is based on the Gibbs-Helmholtz equation. The paper contains the following diagrams and graphs:

- 1) Electromotive force, appertaining to some reactions, as function of temperature.
- 2) Potential of the Diskeleton-Catalytic-Electrode as function of hydrogen overvoltage at constant anodic current.
- 3) Cross-section of porous electrode, according to Justi.
- 4) Diagrammatic sketch of the Bacon cell.
- 5) Hydrogen overvoltage on different electrodes as function of current density.

The results of investigations into the severity of the disease and its residual disabilities show clearly, that the importance of healed tb of the spine is relatively slight. Greater disability was caused by tb of the hip and knee and particularly by other localizations e.g. shoulder, elbow, wrist, hands, ribs and long bones. The question arises with regard to bone and joint tb whether it is suitable to treat joints by ankylosis, or to preserve movable joints. Even though ankylosis marks the definite healing of the lesion, it is of great disadvantage throughout the life of the person affected. Even limited movement of the affected joint is always more useful to the patient. Joints suitably rehabilitated can have good function and power. The author's hospital abandoned bandages 10 yr. ago.
